A METHOD FOR EFFICIENTLY DETERMINING A DNA STRAND BREAK ABSTRACT OF THE DISCLOSURE

distribution in vivo and the frequency of generation in

vivo of DNA strand breaks which induce cell death and
mutations. The present inventors accomplished the present
invention by providing a method for detecting a DNA strand
break in a sample, which comprises a step of binding a PprA
protein derived from Deinococcus radiodurans to a DNA

strand break and a step of detecting the PprA protein which
is bound to the DNA strand break; as well as by providing a
kit for detecting a DNA strand break in a sample which
comprises PprA proteins derived from Deinococcus
radiodurans and a means for detecting a PprA protein which
is bound to a DNA strand break.
